R <i>Bi</i> -package	<i>R<i>Bi</i> - R interface for libbi</i>
----------------------	---

---

## Description

R*Bi* is an interface to libbi, a library for Bayesian Inference

## Details

The package includes a wrapper for the libbi script, allowing to launch the libbi command from within R. It also provides various utility functions to browse the output from libbi, for instance to plot the results.

The package will ultimately be made of various components.

- First there is a wrapper around libbi called [libbi](#).
- Then there are functions to manipulate the results of the libbi command, which are stored in NetCDF files. Those functions allow to extract variables of interest, and to plot them in various ways.

## Author(s)

Pierre E. Jacob <pierre.jacob.work@gmail.com>, Sebastian Funk <sebastian.funk@lshtm.ac.uk>

## References

**Examples**

```
demo(PZ_generate_dataset)
demo(PZ_PMMH)
demo(PZ_SMC2)
demo(PZ_filtering)
```

---

absolute_path	<i>Absolute Path</i>
---------------	----------------------

---

**Description**

This function is used to convert relative file paths to absolute file paths without checking if the file exists as `tools::file_as_absolute_path` does

**Usage**

```
absolute_path(filename, dirname)
```

**Arguments**

filename	name of a file, absolute or relative to a folder
dirname	name of a folder where the file is supposed to be

---

bi_dim_len	<i>NetCDF dimension length</i>
------------	--------------------------------

---

**Description**

This function returns the length of a dimension in a NetCDF file.

**Usage**

```
bi_dim_len(filename, dim)
```

**Arguments**

filename	path to a NetCDF file
----------	-----------------------

**Value**

dimension length

---

bi_dim_values	<i>NetCDF dimension values</i>
---------------	--------------------------------

---

**Description**

This function returns the values of a dimension in a NetCDF file.

**Usage**

```
bi_dim_values(filename, dim)
```

**Arguments**

filename	path to a NetCDF file
----------	-----------------------

**Value**

dimension values

---

bi_file_ncdump	<i>NetCDF File Print</i>
----------------	--------------------------

---

**Description**

This function prints the content of a file using the ncdump command line

**Usage**

```
bi_file_ncdump(filename)
```

**Arguments**

filename	path to a NetCDF file
----------	-----------------------

**Value**

None

---

bi_file_summary	<i>NetCDF File Summary</i>
-----------------	----------------------------

---

### Description

This function prints a little summary of the content of a NetCDF file, as well as its creation time. You can then retrieve variables of interest using [bi\\_read](#).

### Usage

```
bi_file_summary(filename)
```

### Arguments

filename	path to a NetCDF file
----------	-----------------------

### Value

None

---

bi_generate_dataset	<i>Bi Generate Dataset</i>
---------------------	----------------------------

---

### Description

This is a wrapper around `libbi sample --target joint`, to generate synthetic dataset from a model. Parameters can be passed via the 'init' option (see [libbi\\_run](#), otherwise they are generated from the prior specified in the model.

### Usage

```
bi_generate_dataset(endtime, noutputs, ...)
```

### Arguments

endtime	final time index, so that data is generated from time 0 to time "endtime".
noutputs	number of output points to be extracted from the hidden process; default is noutputs = endtime.
...	arguments to be passed to <a href="#">libbi</a> (with run = TRUE), especially 'model'

### Value

path to the output file.

---

bi_init_file	<i>Create init files for LibBi, retained for backwards compatibility</i>
--------------	--

---

### Description

Users should use `bi_write` instead

### Usage

```
bi_init_file(...)
```

### Arguments

... parameters passed to `bi_write`

### Value

whatever `bi_write` returns

### See Also

[bi\\_write](#)

---

bi_model	<i>Bi Model</i>
----------	-----------------

---

### Description

`bi_model` creates a model object for Rbi from a libbi file. Once the instance is created, the model can either be fed to a [libbi](#) object.

### Arguments

filename is the file name of the model file

### See Also

[bi\\_model\\_fix](#), [bi\\_model\\_propose\\_prior](#), [bi\\_model\\_insert\\_lines](#), [bi\\_model\\_update\\_lines](#), [bi\\_model\\_remove\\_lines](#), [bi\\_model\\_write\\_model\\_file](#),

### Examples

```
bi_sir <- bi_model$new(filename = "sir.bi")
```

---

bi_model_fix	<i>Fix noise term, state or parameter of a libbi model</i>
--------------	--

---

**Description**

Replaces all variables with fixed values as given in 'fixed'; note that this will not replace differential equations and lead to an error if applied to states that are changed inside an "ode" block

**Arguments**

... values to be assigned to the (named) variables

**Value**

a bi model object of the new model

**See Also**

[bi\\_model](#)

**Examples**

```
model_file_name <- system.file(package="bi", "PZ.bi")
PZ <- bi_model(filename = model_file_name)
PZ$fix(alpha = 0)
```

---

bi_model_insert_lines	<i>Insert lines in a libbi model</i>
-----------------------	--------------------------------------

---

**Description**

Inserts one or more lines into a libbi model. If one of before or after is given, the line(s) will be inserted before or after a given line number, respectively. If neither is given, the line(s) will be added at the end.

**Arguments**

before	line number before which to insert line(s)
after	line number after which to insert line(s)
lines	vector or line(s)

**Value**

the updated bi model

**See Also**

[bi\\_model](#)

**Examples**

```
model_file_name <- system.file(package="bi", "PZ.bi")
PZ <- bi_model(filename = model_file_name)
PZ$insert_lines(lines = "noise beta", after = 8)
```

---

```
bi_model_propose_prior
```

*Propose from the prior in a libbi model*

---

**Description**

Generates a version of the model where the proposal blocks are replaced by the prior blocks. This is useful for exploration of the likelihood surface.

**Value**

a bi model object of the new model

**See Also**

[bi\\_model](#)

**Examples**

```
model_file_name <- system.file(package="bi", "PZ.bi")
PZ <- bi_model(filename = model_file_name)
PZ$propose_prior()
```

---

```
bi_model_remove_lines Remove line(s) in a libbi model
```

---

**Description**

Removes one or more lines in a libbi model.

**Arguments**

num	line number(s) to remove
-----	--------------------------

**Value**

the updated bi model

**See Also**

[bi\\_model](#)

**Examples**

```
model_file_name <- system.file(package="bi", "PZ.bi")
PZ <- bi_model(filename = model_file_name)
PZ$remove_lines(2)
```

---

bi\_model\_update\_lines *Update line(s) in a libbi model*

---

### Description

Updates one or more lines in a libbi model.

### Arguments

num	line number(s) to update
lines	vector of iline(s)

### Value

the updated bi model

### See Also

[bi\\_model](#)

### Examples

```
model_file_name <- system.file(package="bi", "PZ.bi")
PZ <- bi_model(filename = model_file_name)
PZ$update_lines(23, "alpha ~ normal(mu, sigma)")
```

---

bi\_model\_write\_model\_file  
*Writes a bi model to a file.*

---

### Description

Writes a bi model to a file given by filename. The extension '.bi' will be added if necessary.

### Arguments

filename	name of the file to be written
----------	--------------------------------

### Value

the return value of the [writeLines](#) call.

### See Also

[bi\\_model](#)

### Examples

```
model_file_name <- system.file(package="bi", "PZ.bi")
PZ <- bi_model(filename = model_file_name)
PZ$write_model_file("PZ")
```

---

bi_obs_file	<i>Create Observation Files for LibBi</i>
-------------	---

---

### Description

This function creates a NetCDF observation file given a numeric vector. This file can then be passed to libbi using the `--obs-file` option.

### Usage

```
bi_obs_file(filename, variable, name = "Y")
```

### Arguments

filename	a path to a NetCDF file to write the variable into, which will be overwritten if it already exists.
variable	a numeric vector of observations.
name	a string representing the name to be used in the NetCDF file; default to "Y".

### Value

None, but creates a NetCDF file at the specified path.

### Note

Note that it creates a time variable with indices starting from 1, and not from 0.

---

bi_open	<i>Bi open</i>
---------	----------------

---

### Description

This function opens a NetCDF file. The file can be specified as a string to the filepath, in which case a NetCDF connection is opened, or directly as a NetCDF connection.

### Usage

```
bi_open(read)
```

### Arguments

read	either a path to a NetCDF file, or a NetCDF connection created using <code>nc_open</code> , or a <code>libbi</code> object from which to read the output
------	--

### Value

open NetCDF connection

---

bi_read	<i>Bi Read</i>
---------	----------------

---

### Description

This function reads all variable from a NetCDF file or the output of a [libbi](#) object. The file can be specified as a string to the filepath, in which case a NetCDF connection is opened, or directly as a NetCDF connection.

### Usage

```
bi_read(read, vars, dims, missval.threshold, variables, time_dim, vector, thin,
        verbose)
```

### Arguments

read	either a path to a NetCDF file, or a NetCDF connection created using <code>nc_open</code> , or a <a href="#">libbi</a> object from which to read the output
vars	variables to read; if not given, all will be read
dims	factors for dimensions
missval.threshold	upper threshold for the likelihood
variables	only extract given variables (for space saving)
time_dim	name of time dimension (if any)
vector	if TRUE, will return results as vectors, not data.frames.
thin	thinning (keep only 1/thin of samples)

### Value

list of results

---

bi_read_var	<i>Bi Read Variable</i>
-------------	-------------------------

---

### Description

This function reads a variable from a NetCDF file. The file can be specified as a string to the filepath, in which case a NetCDF connection is opened, or directly as a NetCDF connection.

### Usage

```
bi_read_var(resultfile, name, coord, ps, ts)
```

### Arguments

resultfile	either a path to a NetCDF file, or a NetCDF connection created using <code>open.ncdf(filename)</code>
name	name of the variable to read (use <a href="#">bi_file_summary</a> to learn about the variable names of a specific file)
coord	dimension indices (not implemented yet)
ts	time indices (not implemented yet)

---

bi_write	<i>Create (init or observation) files for LibBi</i>
----------	---

---

### Description

This function creates an init file to specify parameter values and initial conditions. This file can then be passed to libbi using the `--init-file` option.

### Usage

```
bi_write(filename, variables, timed, ...)
```

### Arguments

filename	a path to a NetCDF file to write the variables into, which will be overwritten if it already exists.
variables	a list object, which names should be the variable names and values should be either single values, vectors of equal length, or data frames; or a single element of the type
timed	if TRUE, any elements of variables that are vectors will be assumed to have a time dimension
...	arguments passed to <a href="#">netcdf_create_from_list</a>
time_dim	name of the time dimension, if one exists

### Value

None, but creates a NetCDF file at the specified path.

---

get_traces	<i>Get the parameter traces</i>
------------	---------------------------------

---

### Description

This function takes the provided [libbi](#) which has been run and returns a data frame with the parameter traces.

### Usage

```
get_traces(run, all = FALSE, model, ...)
```

### Arguments

run	a <a href="#">libbi</a> object which has been run, or a list of data frames containing parameter traces (as returned by <code>bi_read</code> ); if it is not a <a href="#">libbi</a> object, either 'all' must be TRUE or a model given
all	whether all variables in the run file should be considered (otherwise, just parameters)
model	a model to get the parameter names from; not needed if 'run' is given as a <a href="#">libbi</a> object or 'all' is set to TRUE
...	parameters to <code>bi_read</code> (e.g., dimensions)

**Value**

data frame with parameter traces; this can be fed to coda routines

---

libbi	<i>LibBi Wrapper</i>
-------	----------------------

---

**Description**

libbi allows to call libbi. Upon creating a new libbi object, the following arguments can be given. Once the instance is created, libbi can be run through the run method documented in [libbi\\_run](#).

**Arguments**

client	is either "draw", "filter", "sample"... see LibBi documentation.
model	either a character vector giving the path to a model file (typically ending in ".bi"), or a bi_model object
config	path to a configuration file, containing multiple arguments
global_options	additional arguments to pass to the call to libbi, on top of the ones in the config file
working_folder	path to a folder from which to run libbi; default to a temporary folder.
path_to_libbi	path to libbi binary; by default it tries to locate libbi
input	input file (given as file name or libbi object or a list of data frames
init	init file (given as file name or libbi object or a list of data frames
obs	observation file (given as file name or libbi object or a list of data frames
run	(boolean) whether to run the model using the which Unix command, after having loaded "~/bashrc" if present; if unsuccessful it tries "~/PathToBiBin/libbi"; if unsuccessful again it fails.

**See Also**

[libbi\\_run](#)

**Examples**

```
bi_object <- libbi$new(client = "sample",
                      model = system.file(package="bi", "PZ.bi"),
                      global_options = list(sampler = "smc2"))
```

libbi\_run

*Using the LibBi wrapper to launch LibBi***Description**

The method run of an instance of `libbi` allows to launch libbi with a particular set of command line arguments.

**Arguments**

<code>add_options</code>	additional arguments to pass to the call to libbi
<code>output_file_name</code>	path to the result file (which will be overwritten)
<code>stdoutoutput_file_name</code>	path to a file to text file to report the output of libbi
<code>init</code>	initialisation of the model, either supplied as a list of values and/or data frames, or a (netcdf) file name, or a <code>libbi</code> object which has been run (in which case the output of that run is used as input)
<code>input</code>	input of the model, either supplied as a list of values and/or data frames, or a (netcdf) file name, or a <code>libbi</code> object which has been run (in which case the output of that run is used as input)
<code>obs</code>	observations of the model, either supplied as a list of values and/or data frames, or a (netcdf) file name, or a <code>libbi</code> object which has been run (in which case the output of that run is used as observations)
<code>verbose</code>	if TRUE, will run libbi with the <code>'-verbose'</code> option
<code>...</code>	any onrecognised options will be added to <code>add_options</code>

**Value**

a list containing the absolute paths to the results; it is stored in the `result` field of the instance of `libbi`.

**See Also**

`libbi`

**Examples**

```
bi_object <- libbi$new(client = "sample",
                      model_file_name = system.file(package="bi", "PZ.bi"),
                      global_options = list(sampler = "smc2"))
bi_object$run(add_options=list(nthreads = 1), verbose = TRUE)
bi_file_summary(bi_object$result$output_file_name)
```

---

log2normw	<i>Normalize log weights</i>
-----------	------------------------------

---

**Description**

This function takes a vector of real values, then takes the exponential and divides by the sum. Subtracting the max of the original values increases the numerical stability.

**Usage**

```
log2normw(lw)
```

**Arguments**

lw	a vector of real values
----	-------------------------

**Value**

a vector of normalized values (summing to 1)

---

netcdf_create_from_list	<i>Create NetCDF File from R list</i>
-------------------------	---------------------------------------

---

**Description**

This function creates a NetCDF file given a list.

**Usage**

```
netcdf_create_from_list(filename, variables, time_dim = "nr",
  value_column = "value")
```

**Arguments**

filename	a path to a NetCDF file to write the variable into, which will be overwritten if it already exists.
variables	a list
time_dim	the name of the time dimension, if one exists; "nr" by default
value_column	if any variables are data frames, which column contains the values (default: "value")

**Details**

The list of variables must follow the following rules. Each element of the list must itself be one of:

- 1) a list with two keys; the first key must be named "values" and contains a numeric vector; the second key must be named "dimension" and contains a string giving the dimension name.
- 2) a data frame with a value\_column column (see option 'value\_column') and any number of other columns indicating one or more dimensions
- 3) a numeric vector of length one, with no dimensions

The name of the list elements itself is used to create the corresponding variable in the NetCDF file.

**Value**

None, but creates a NetCDF file at the specified path.

**Note**

Two elements of the given list can possibly have the same dimension name.

**Examples**

```
filename <- tempfile(pattern="dummy", fileext=".nc")
a <- list(values = 1:3, dimension = "dim_a")
b <- list(values = 1:5, dimension = "dim_b")
c <- list(values = 5:9, dimension = "dim_b")
d <- 3
e <- data.frame(dim_a = rep(1:3, time = 2), dim_c = rep(1:2, each = 3), value = 1:6)
variables <- list(a=a, b=b, c=c, d=d, e=e)
netcdf_create_from_list(filename, variables)
bi_file_ncdump(filename)
```

---

option_list	<i>Convert string to option list</i>
-------------	--------------------------------------

---

**Description**

This function is used to convert an option string into a list of options. If a list is given, it will be kept as is

**Usage**

```
option_list(...)
```

**Arguments**

... any number of strings to convert

**Value**

option list

---

option_string	<i>Convert Options</i>
---------------	------------------------

---

**Description**

This function is used to convert a list of options into an options string. If a string is given, it will be taken as such.

**Usage**

```
option_string(...)
```

**Arguments**

... any number of lists of options, or strings (which will be left unmodified). If lists are given, later arguments will override earlier ones

---

read_var_input	<i>Read variable from NetCDF file.</i>
----------------	--

---

**Description**

Read variable from NetCDF file.

**Usage**

```
read_var_input(nc, name, coord, ps, ts)
```

**Arguments**

nc	NetCDF file handle
name	Name of the variable
coord	(optional) Dimensions index.
ps	(optional) Path indices.
ts	(optional) Time indices.

**Value**

read values
